

R4i WebView adds hardware and software portability to your Interactive Electronic Technical Manuals (IETM) distribution.

Maintainers and operators can access technical information directly from the R4i Common Source Database (CSDB) regardless of the devices operating system or browser type.

Integrated with R4i CSDB Server, access to content within R4i WebView is managed by the publishing team. The R4i WebView displays the information in real-time including images and PDF files. As a module available in the R4i S1000D software suite, the R4i WebView includes unlimited users per server.

A scalable solution, R4i WebView connects directly to the R4i S1000D CSDB via a web browser, without the need for 3rd party plug-ins.

R4i WebView offers flexible support for:

- Both XML and SGML content.
- All S1000D DTD/Schema types from v1.7 to v4.2.
- Viewing S1000D, MIL-STD and ATA iSpec data.
- Dynamic conversion of CGM to SVG illustrations with hotspots.
- IE, Firefox, Chrome, Edge and Safari.
- User access control and content security.

Microsoft Internet Information Server running on Windows Server 2012, 2012 R2 or 2016, powers the R4i WebView system. We also recommend 16 GB of system memory.
